RE: unzip command line option to drop the file name from the zip file name The option -x or --extract can help, there are some useful details in the manual From the manual: -x or --extract Extract archives without prompting. The default action depends on the platform. If the archive to be extracted is a ZIP or CAB archive, then by default the contents are extracted to the directory of the archive file. If the archive is GZipped, then the contents are extracted to the current working directory. This command-line option can be used multiple times. This seems to be a possible work around, as it allows the contents of the zip to be extracted to the current directory rather than being extracted into the folder in the archive. In the past, doors or walls inside a building structure were made of framed, drywall construction, to include panels of three-quarter inch of gypsum board covered by flat wallboard. With such constructions, air-tightness was not a significant issue since the construction was only a barrier against noise and weather. However, because of cost and other factors, it was desirable to have an open construction, as in the case of a window or a door, for instance. In a window it is necessary to have an air-tight window construction, in order to keep noise and air-conditioning out of the building. In addition, in buildings which have their windows and doors open to the outside, such as garages, stock houses and the like, it is desirable that the air-tightness of the building construction be maintained to prevent insects from entering the building and spreading thereabout. Accordingly, in the past, various materials have been used to construct an
