## Thomas Carriers

I came across a really cool sight. I was not able to find any information on the collection, just a lot of really nice stuff. It's also really great to find it in real life. A: You can find a Thomas world map at railway-maps.com. In addition, there is also a Thomas world map (instructions on how to use it): Although it includes all of THOMAS world, you can zoom out to find all of the coalpits and remove certain regions from it, such as North

Africa, Australia and Antarctica. You can enable/disable it in the Configure option under the Map menu. If you click on a region and choose "Show in World" you can zoom into that area on the world map. Where Thomas world can be found: Region/area to Zoom into Siam (Thailand) East Asia Pacific North America North Africa Middle East South America South Africa Sub-Saharan Africa North Europe West Europe E.U.

South America South Asia East Asia Oceania Africa Middle East Central America Central and South America The Caribbean United States

Canada Note: If you had added the world map to your site, it will show all the areas, so no need to add any regions. Good luck! Q: Character Encoding in .Net MVC Having a hard time with character encoding in MVC. I have a model that is coming in from a rest call. The server sends back characters like "ñ" and "Ñ" but on the model it shows a question mark and a plus. I'm using the following function to encode the characters but I'm not sure if it's correct. `public static string EscapeCharacters(string value) { return Regex.Replace(value, @"\\W", ""); }` Any suggestions on what I'm doing wrong, what encoding do I need to look at? A: By default, `String.ToString()` uses the current thread culture for the `CurrentCulture` property. Using that property and the `InvariantCulture` property, I can create this

[\*\*Download\*\*](#)

Category:Thomas & FriendsQ: Returning non-numeric values I'm working on a website in which theres a text field that accepts a price. I have a price\_greater\_than function to accept only numeric values, but I don't know how to say "if price is not numeric, return a value with say 13 characters". How can I use PHP to do this? Thanks in advance.

A: Use is\_numeric: \$a\_test = "A string, or a float."; var\_dump(is\_numeric(\$a\_test));  
/\* bool(false) \*/ A: if (is\_numeric(\$var))

---

{ //... } From PHP.net: is\_numeric Tests if the given string is numeric in the traditional sense of the word. A: I think you can do it with parse\_str(): \$price = \$\_GET['price']; if (is\_numeric(\$price)) { \$price = (float) \$price; \$price = (int) \$price; } parse\_str(\$price, \$arr); Now you have \$arr['price'], but if you don't want to use it just use number\_format(\$price, 5, '.', ''); or number\_format(\$price, 13, ',', '.');

Q: Mensaje "No se reconoce la función format" a la hora de decir, "Had a nice day" He escuchado muchas veces en televisión, radio y otros medios de comunicación este mensaje No se reconoce la función format En cuanto a como la debo formatear, se me ocurre decir, "Had a nice day". ¿Sería necesario

---

decirlo con las y símbolos antes de "Had a nice day"?. Por ejemplo: No se f678ea9f9e
